

JOHN EDEH

Full-Stack Engineer • Web Applications, Infrastructure & Security

Lagos, Nigeria | netojaycee@gmail.com | 09035348684 | johndeh.com

I build products end to end and stay accountable for them after they ship. That means designing the interface (React, Next.js, TypeScript), the API and data model behind it (NestJS, FastAPI, PostgreSQL), and the infrastructure it runs on (Docker, AWS, self-managed VPS) — and it means being the one who gets paged when something breaks, not just the one who wrote the original code. As one of two engineers running the entire technical footprint of Nigeria’s leading digital newspaper, I’ve root-caused cascading production outages, tuned infrastructure against live traffic data, and closed real security vulnerabilities. Across my own solo-built systems — a financial SaaS with a full double-entry ledger, an international festival’s public platform, a real-time multiplayer event platform load-tested at scale — I’ve recovered from a live production incident by building a purpose-built repair tool rather than patching around it, and I keep an honest, git-verified record of what I actually built solo versus what a team built. I work agent-paired with Claude and GitHub Copilot as standard daily practice, and documentation-first as a discipline, not an afterthought.

CORE COMPETENCIES

Frontend: React, Next.js (13–16), TypeScript, JavaScript (ES6+), Tailwind CSS, responsive and mobile-first web development

Backend & Data: NestJS, FastAPI (Python), Node.js, REST API design, PostgreSQL (including double-entry ledger systems), Redis, Prisma, multi-tenant architecture

DevOps & Infrastructure: Docker & Docker Compose, AWS (EC2, RDS, S3, CloudWatch), Nginx, Cloudflare DNS/CDN, GitHub Actions CI/CD, VPS provisioning and hardening

Security & Reliability: Production incident root-causing under live traffic, live vulnerability discovery and remediation, backup/disaster-recovery systems tested via real restore drills, load testing at scale

AI-Augmented Engineering: Claude and GitHub Copilot as standard practice, agent-paired development, documentation-first workflow (ARCHITECTURE.md, STATUS.md, CLAUDE.md)

EXPERIENCE

Full-Stack & DevOps Engineer

Nov 2024 – Present

Punch Newspaper (Punch Nigeria Ltd) — Nigeria’s leading digital newspaper • Lagos

- One of two engineers who own the site’s entire production footprint end to end: application layer, database, CDN, servers, and incident response, at ~23M page views/month scale.
- Ran a live, data-driven PHP-FPM tuning campaign against a host pinned at 84–99.6% CPU for 24h+, and root-caused a cascading four-bug production outage chain, each fix unmasking the next.
- Diagnosed a three-bug chain behind broken XML sitemaps, tracing one root cause into WordPress’s own core source, and found and fixed a reflected XSS vulnerability on live production.
- Designed and built a standalone FastAPI + Celery AI microservice with a sync/async SLA split so an AI dependency can never stall the parent application; caught a distributed-systems re-entrancy bug mid-migration.
- Recovered 96,000+ images after an S3 failure, resolved recurring RDS CPU spike incidents, and authored the team’s infrastructure roadmap and 2026 technical blueprint.

Full-Stack Developer (Remote)

Jun 2025 – Jun 2026

FuelsGate — B2B petroleum SaaS

- Solo-rebuilt a B2B petroleum SaaS from an earlier MongoDB application into a NestJS + Prisma + PostgreSQL API with three Next.js frontends and a FastAPI AI microservice — full ownership of architecture, data modeling, backend, frontend, DevOps and security across 16+ build phases.
- Built a FIFO-based delivery-ledger P&L engine with immutable profit snapshots, and a permission-scope model that resolves live at query time rather than being snapshotted at grant time.

Full-Stack Developer (Remote)

Dec 2023 – Apr 2026

MHAPY — Canada

- Delivered full-stack features in Next.js, React and TypeScript as part of a fully remote, cross-timezone team.

Full-Stack Developer

Jul 2023 – Jun 2024

BFG Global Consults

- Built full-stack features in Next.js and React with TypeScript.

SELECTED PROJECTS

xfinance (xfinance.ng) | Solo • NestJS + Next.js • PostgreSQL • Live production payments

Full double-entry ledger and financial reporting SaaS (multi-tenant and white-label standalone modes). Root-caused a live ledger-corruption incident and built a purpose-built, backup-first CLI repair tool that replays the transaction ledger as the sole source of truth. Found and fixed a revenue-recognition bug present in seven separate places, unifying it into one consistent calculation.

LagosPhoto (lagosphotofestival.com) | Solo · FastAPI + Next.js · PostgreSQL/pgvector

Full public site and CMS for an international photography festival, including a complete legacy-site migration (32 artists, 37 exhibitions, ~100 events) and a dual semantic/trigram search system built directly on Postgres extensions.

Apoquiz (quiz.afmweca.org) | Team of 2–3 (49% of commits) · NestJS + Socket.IO + Next.js

Real-time multiplayer quiz platform run live at a public tournament (500+ audience, 5 teams). Built a from-scratch load-testing harness simulating 500+ concurrent users, found a genuine $O(N^2)$ broadcast bug, and cut broadcast messages by ~96%, verified on a real 600-bot run with zero errors.

AVDAN | Majority contributor (~69%) · Modular FastAPI backend · 8 clients

Multi-sided logistics and marketplace platform (customer, vendor, rider, hub, admin). Found and closed a live object-storage exposure, and built refresh-token rotation with server-side revocation on use.

Production Incident Response — Client WordPress Site | punchfoundation.org

Diagnosed a 6-day-old silent outage caused by a boot-time service race between two competing nginx installs, reconstructing the timeline from passive log evidence before making any change, then fixed and verified recovery end to end.
